

The `simple.fe` file applies roles to the files based on what directory they're in.

For example, all files in the directory `"simple_example"` have the `simple_var_t` role (or maybe type, since it has `"_t"`) applied to it. Therefore, all the files in directory `"simple_example"` will have the privileges of the `simple_var_t` role/type.

For the `simple.te`, I believe this file defines what the roles are.

I think it gives the `"simple_var_t"` role read and write permissions under the `"simple local policy"` section. I'm not too sure what the top half in the `"declarations"` section is for, although I'm assuming it's some kind of initialization.
